

La Jolla Luxury Home: Hot and Cold Potable Water Rehabilitation

Location: La Jolla, California

Situation:

The contractor of an under-construction, 11,000-square-foot residence was referred to Nu Flow to protect the new home's copper, underground potable system from corrosion and pinhole leaks, which are very common in copper pipes due to the natural corrosiveness of potable water.

Solution:

Nu Flow applied our patented epoxy coating to all of the underground hot and cold potable water lines using our blown-in technology. The contractor and homeowner now have the comfort of knowing that our epoxy barrier will protect the hard-to-reach copper pipes from common problems.
